Website Documentation: Goals and Plan for motorshow

The Motorshow website is a project aimed at creating a professional online presence for my motor show. Drawing from my learnings on W3Schools, the goal is to build a platform that combines functionality, design, and user experience. The website will feature a clean layout, intuitive navigation, and responsive design, ensuring accessibility across devices. Key sections like a homepage, login, and contact form will be structured using semantic HTML, with CSS enhancing the visuals through modern design techniques such as grids and flexbox.

W3Schools has been instrumental in shaping my approach to this project, providing tutorials and hands-on examples that deepened my understanding of web development. Its lessons on responsive design, animations, and SEO techniques have influenced my plan to create a site that is visually appealing, optimized for search engines, and fast-loading. By integrating these skills, I aim to deliver a seamless experience for users while showcasing my store's unique offerings. The Motorshow website is not just a technical achievement but also a reflection of my dedication to leveraging technology to grow my business.
